In observations with the purified virus, images of
groups of viral particles isolated from the infected
cells were obtained. The particles were oval or square
and averaged 330 x 230 mμ size. In the ultrathin
section images, we observed inclusion bodies (Hender-
son-Patterson molluscum body) in the cytoplasm and,
inside of these, many viral particles in clusters or
bunches. In the inclusion bodies, the presence of septa
